

10. ABSTRACT OF THE DISCLOSURE

The new technology introduced in this process is the innovative combination of equipment, tool and plumbing, that is, providing "point of contact" water spray, while complying with other provisions of EPA and OSHA required procedures, including training,. Combining existing technologies in a new and innovative technique which will reduce worker exposures to health and safety hazards as well as satisfy the environmental concerns generally associated with this procedure, represents a cutting edge enhancement of an existing industry practice. Mechanical removal in the past violated the "no visible emissions" and the OSHA requirement to maintain material in a wet condition. Manual removal introduces significant worker health and safety issues.
